

MB Atego container concept

DAF LF

### Rescue truck

Plastisol produces tailor-made GRP (Glassfibre Reinforced Polyester) superstructures for rescue vehicles. These superstructures are made to customer specification and can be produced to fit any type of commercial chassis.

The interior of the superstructure is equipped with C-profiles, to enable the enduser to create a flexible and easy-access shelving system.

The rescue superstructure is also available in a container concept. The separate rescue containers can be divided in an emergency situation so that help can be provided in multiple locations.

### The GRP material has the following advantages:

- Long economical life cycle
- Light weight construction
- Easy to repair in case of damage
- 100% corrosion proof
- Flame retarding / Self extinguishing
- Maintenance free
- Unlimited design possibilities
- Shock absorbing
- Self-supporting constructions
